<p>A multi-use desalination plant for obtaining fresh water from sea water, uses heat of solar collector for evaporative concentrator and heat exchanger for condensation is provided in a thermal storage tank</p> <p>C2001-038488</p>	<p><u>NOVELTY</u> Evaporative concentration tanks (5-7) in series receive sea water and generates water vapor. The heat for evaporative concentration is obtained from heat medium circulation pipes (36,37) connected to a solar collector (9). The water vapor generated in the concentration tanks (5-7) are cooled to obtain fresh water in a condensation heat exchanger (12) which is installed in a thermal storage tank (11).</p> <p><u>USE</u> For obtaining fresh water from sea water.</p> <p><u>ADVANTAGE</u> The invention offers an economical desalination plant as heat for</p>	<p>JP 2000325945-A+</p>
